## Introduction

### Our Company

ACME Electronics Corporation, a subsidiary of public listed company, USI Corporation, Taiwan is one of the world's leading manufacturers of soft ferrite products for the electronics industry.

Incorporated in 1991 and listed in the Taiwan OTC Securities Market in February, 2005, ACME has her headquarters in Nei-Hu District, Taipei, Taiwan and 4 manufacturing facilities in Kuan-Yin Industrial District, Taoyuan County, Taiwan; Ipoh, Perak, Malaysia; Kunshan City, Jiangsu Province and Zengcheng City, Guangdong Province in China.

Headquarter of USI Group, Taipei

### Our Products

At ACME, we manufacture a very wide range of Manganese-Zinc and Nickel-Zinc soft ferrite products in different shapes and sizes. These products are used for the manufacture of chokes, inductors, filters, transformers, antennas and other components and devices that are applied in the communication, lighting, alternative energy, automotive, consumer and industrial electronics. ACME's products are used by leading manufacturers of these components and devices worldwide.

### Our History

**1991** – ACME Electronics Corporation, Taiwan was incorporated

**1994** – Built the first manufacturing facility in Kuan-Yin District, Taoyuan County, Taiwan

**2000** – Incorporated ACME Electronics (Kunshan) Co. Ltd., China and built a modern manufacturing facility to service the market in Northern and Eastern China. This factory had been expanded and equipped with the latest machinery and equipment. It now has a capacity of 6,800 metric tonnes a year.

**2005** – Incorporated ACME Electronics (Guangzhou) Co. Ltd., China. Located in Zengcheng City, this new and well equipped facility has a capacity of 6,300 metric tonnes a year and services the market in Southern China.

**2009** – Acquired ACME Ferrite Products Sdn. Bhd., Malaysia. Located in Ipoh, Perak, ACME Malaysia is a leading Nickel-Zinc soft ferrite manufacturer that specialises in ferrite products for the automotive industry. This facility has a capacity of 1,200 metric tonnes a year.

Kuan-Yin Factory, Taiwan

**AGGRESSIVELY  
COMMITTED TO  
MANUFACTURING  
EXCELLENCE**

## INTRODUCTION TO FERRITES

Ferrite is categorized as electroceramics with ferrimagnets properties.

Ferrite exhibits ferrimagnetism due to the super exchange interaction between electrons of metal and oxygen ions. The opposite spins in ferrite results in lowering of magnetization compared to ferromagnetic metals where the spins are parallel. Due to the intrinsic atomic level interaction between oxygen and metal ions, ferrite has higher resistivity compared to ferromagnetic metals. This enables the ferrite to find application at higher frequencies and makes it technologically very valuable.

### Ferrite Crystal:

The magnetic property of ferrite is the manifestation of nature of ions and their relative lattice position. Ferrite exists in spinel lattice structure. Metal ions are located at octahedral and tetrahedral positions.  $\text{Fe}^{2+}$ ,  $\text{Ni}^{2+}$ ,  $\text{Mn}^{2+}$  etc ions prefer to occupy the octahedral sites and  $\text{Fe}^{3+}$  and  $\text{Zn}^{2+}$  prefer tetrahedral sites. NiZn ferrite and MnZn ferrites has inverse spinel structure where the part of the B atoms occupies in the tetrahedral site and A atom occupy the Octahedral site. Depends on composition and process conditions such as sintering temperature and atmosphere, the lattice site occupancy changes, leading to the change in magnetic and electrical properties. This show that in ferrite manufacturing both composition and process conditions are very critical to get the required quality.

○ Oxygen

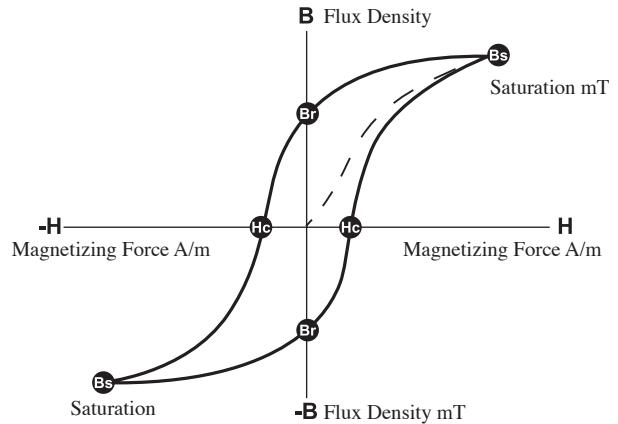

● B-atoms octahedral sites

● A-atoms tetrahedral sites

The chemical formula of ferrite is generally expressed as  $\text{MeFe}_2\text{O}_4$ . Where Me represents a divalent metal ion. (e.g.  $\text{Fe}^{2+}$ ,  $\text{Ni}^{2+}$ ,  $\text{Mn}^{2+}$ ,  $\text{Mg}^{2+}$ ,  $\text{Co}^{2+}$ ,  $\text{Zn}^{2+}$ ,  $\text{Cu}^{2+}$ etc). The crystal lattice of ferrite is spinel. Most important commercial derivatives of these ferrites are  $\text{Zn}^{2+}$  substituted Ni and Mn ferrite represented as  $\text{NiZnFe}_2\text{O}_4$  and  $\text{MnZnFe}_2\text{O}_4$  respectively. Major difference among these two ferrites is in their resistivity.

### Ferrimagnetism:

Ferrites exhibits ferrimagnetism. This means there is net magnetic moment in molecular level as a result of electronic interaction between Metal and oxygen ions called super exchange. In a bulk ferrite, there are domains called Wiess Domains in which all these molecular magnets are aligned in one direction. Domain wall separates different domains aligned in random directions and in presence of an external magnetic field these moments can be forced to align in one direction. Some energy has to be spent for this process and the magnetization always lags behind the magnetizing field and results in a magnetization loop. It is called as B-H Loop.

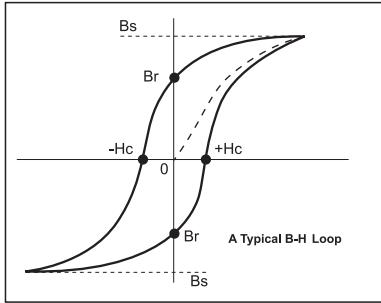

## MAGNETIC PROPERTIES

Some of the important features of NiZn ferrite are described here in order to give a glimpse of the magnetic properties to our valued customer.

### 1. B-H HYSTERESIS LOOP

A non-magnetized Ferrite when subjected to an AC magnetic field creates a loop of above pattern. At very low field, the BH relation is reversible and on higher fields the relation becomes non-linear and non-reversible. Saturation magnetization ( $B_s$ ) represents the saturation limit of flux density and Remanence ( $B_r$ ) is the residual flux even after the withdrawal of the inducing field. Coercivity ( $H_c$ ) is the magnetic field required in the opposite direction to demagnetize the ferrite. The internal resistance imposed by anisotropy and other pinning center causes the delay in magnetization. The energy consumed to overcome this resistance is indicated by the area of the BH loop and is called hysteresis loss.

Ferrite cores are manufactured as per customer requirements and a wide range of products are available with different sizes and shapes. Correct materials are to be selected to make finished ferrite to suit all the customer requirements. The material properties are defined on a standard toroid. These material properties are used as a guideline to manufacture the right component.

### 2. PERMEABILITY

Most significant property of ferrite, which determines its performance, is the permeability and its response to external factors like Temperature, Frequency and Bias field. Permeability is the ratio of magnetic flux density (B) to the magnetic field causing the flux generation (H). In simple terms the 'B' is related to 'H' by  $B = \mu_0 H$  where  $\mu_0$  is the permeability of vacuum,  $4\pi \times 10^{-7}$  H/m.

Initial permeability of ferrite material is defined by

$$\mu_i = \frac{1}{\mu_0} \cdot \frac{\Delta B}{\Delta H} \quad \text{limit } H \longrightarrow 0$$

Initial permeability is measured on toroidal cores at the very low applied field. The flux density generated may be less than 0.1mT.

Initial permeability is calculated from the measured value of inductance (L) and calculated value of core factor  $C_1$  using the formula

$$\mu_i = \frac{L \cdot C_1 \cdot 10^{-6}}{\mu_0 \cdot N^2}$$

L in nH

$$\mu_0 = 4\pi \times 10^{-7} \text{ H/m}$$

N = Number of turns

$$C_1 = \sum \frac{l_e}{A_e} \quad l_e = \text{the magnetic patch length} \quad A_e = \text{the sectional core Area}$$

### 3. MAGNETIC FLUX DENSITY (B)

Ferrite when subjected to a magnetizing field induce magnetic flux ( $\Phi$ , Webster) and the flux per unit area is the flux density (B, Tesla). As Tesla is a larger unit, a smaller unit mT ( $=10^{-6}$ T) is used for all practical applications. Flux density is the product of permeability and applied field.

$$B = \mu_0 \mu H$$

$\mu_0$  is the permeability of vacuum

$\mu$  is the permeability of the ferrite material

### 4. EFFECTIVE PERMEABILITY

Purposefully, air gap is introduced in the ferrite core for technical benefits. The shearing of B-H loop helps to increase the saturation limit to the core. The permeability of gapped core ( $\mu_e$ ) reduces as a function of the air gap.

$$\mu_e = \frac{\mu_i}{1 + \frac{\mu_i G}{l_e}}$$

### 5. AMPLITUDE PERMEABILITY

It is the ratio of the flux density and the applied field at higher field in the absence of DC bias field.

$$\mu_a = \frac{1}{\mu_0} \cdot \frac{B}{H}$$

### 6. INCREMENTAL PERMEABILITY

There are many application conditions where DC bias is applied. The incremental permeability ( $\mu_\Delta$ ) is that observed when an ac field is superimposed with a DC field.

$$\mu_\Delta = \frac{1}{\mu_0} \cdot \frac{\Delta B}{\Delta H} \quad \text{under } H_{dc}$$

## 7. DISACCOMMODATION FACTOR (d)

This represents the time stability of permeability. The decrease in Permeability is almost proportional to the log (Time).

$$d = (\mu_1 - \mu_2) / \mu_1 \log_{10} t_2 / t_1$$

And disaccommodation factor is defined as

$$D.F = (\mu_1 - \mu_2) / \mu_1 \log_{10} t_2 / t_1$$

## 8. INDUCTANCE & INDUCTANCE FACTOR

Inductance is the property of an inductor to induce emf when there is a change in current. It is also the flux linkage to unit current. The unit of inductance in Henry.

$$L = N \Phi/I \text{ Henry}$$

Where  $N$  = Number of turns

$I$  = Current in Amp.

$\Phi$  = Flux in Webster

Inductance is the property of a conductor or a circuit, which resist the change in current. Hence, it causes current changes to drag behind voltage changes. An inductor stores the energy in the form magnetic field.

Inductance is proportional to square of number of turns and the proportionally constant is called inductance factor ( $A_L$ ) ie,

$$L = A_L N^2 \text{ OR } A_L = L/N^2$$

## 9. Loss angle:

Magnetic loss is expressed as loss tangent ( $\tan \delta$ ) and the contribution comes from inductive (reactive,  $\omega L_s$ ) and resistive,  $R_s$ .  $\tan \delta$  is the loss angle i.e., the angle between the Flux ( $B$ ) and Applied field ( $H$ ).

$$\tan \delta = \omega L_s / R_s$$

There is a direct relation between loss angle and imaginary ( $\mu''$ ) and real( $\mu'$ ) part of complex permeability as

$$\tan \delta = \mu'' / \mu'$$

Loss factor is defined as the ratio of loss angle to initial permeability. This is inverse of Q- factor.

## 10. Q- factor:

Quality factor is inverse of loss factor,  $\tan \delta / \mu_i$ . NiZn ferrite is capable of giving higher Q factor at higher resistivity compared to MnZn ferrite. Q is sensitive to not only the chemical composition but the post sintered handling also. Proximity to

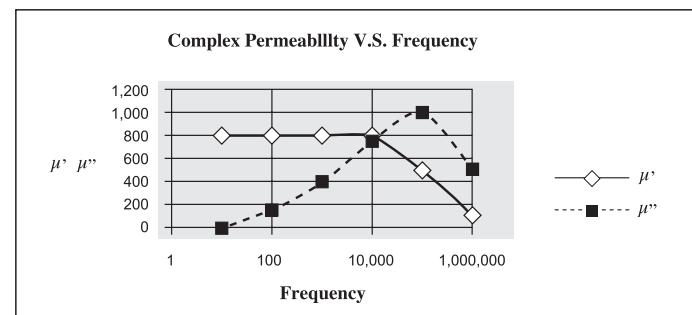

strong magnetic field or mechanical stress can reduce Q value of ferrite.

## 11. Complex permeability:

In a series inductive circuit, the reactive and resistive components are related to complex permeability by:

$$\mu'' = R_s / \omega L_o \quad \text{and} \quad \mu' = L_s / L_o$$

Where  $\mu''$  is the imaginary component of the series complex permeability and  $\mu'$  is the real component of the series complex permeability. The graph below shows the behaviour of initial permeability(real and imaginary) at different frequencies.

## 12. Impedance:

Impedance is the combined effect of capacitance, inductance, and resistance on a signal. According to Ohm's law, voltage is the product of current and resistance at a given frequency. Impedance is a measure of resistance to electrical current flow when a voltage is moved across it. Impedance is measured in ohms and is the ratio of voltage to the flow of current.

For a series circuit, the Reactance is

$$X = j \omega L_s$$

and Resistance is  $R_s$  then the impedance,

$$Z = j \omega L_s + R_s$$

The impedance also be expressed in terms of complex permeability as

$$Z = j \omega L_s (\mu'_s - j\mu''_s)$$

In low frequencies, the inductance is prominent and at higher frequencies, the Resistance.

To have a high Q component, the resistance part must be low and inductive part must be high. At higher frequencies, these inductors act not as inductors but as resistors dissipating the noises in to heat and perform as a noise suppressor.

Hence, in the selection of ferrite for EMI suppressor, the impedance in the selected noise band is important.

Thus the impedance can be translated in to magnetic characteristics separating out the real and imaginary part.

Another expression for impedance is

$$Z = \sqrt{(R^2 + X^2)} = \omega L_o \sqrt{(\mu'^2 + j\mu''^2)}$$

$$\text{Where } L_o = \mu_o N^2 A_e / l_e$$

One advantage of this equation is that the impedance is proportional to the square of the number of winding (N) for a same product.

### 13. Resistivity:

Resistivity of Ferrites depends on its chemistry. NiZn ferrite has a resistivity of more than 1 MΩ-m and that of MnZn ferrite is in the range of 1 to 100Ω-m. Due to the higher resistivity of NiZn ferrite, eddy current losses are at minimum and makes it useful at higher frequency applications. The DC resistivities reported are measured at room temperature (25°C). The resistivity reduces at higher frequencies as the grain boundaries get short-circuited due to electron hopping.

### 14. CORE CONSTANTS

For a non-uniform core, a hypothetical toroid equivalent can be calculated using:

$$C_1 = \sum I/A \quad (\text{mm}^{-1}) \quad C_2 = \sum I/A^2 \quad (\text{mm}^{-3})$$

And effective parameters are calculated from  $C_1$  &  $C_2$

$$\text{Effective Area, } A_e = C_1 / C_2 \quad \text{mm}^2$$

$A_e$  of ferrite is inversely proportional to saturation current and directly proportional to attenuation.

$$\text{Effective path length, } L_e = C_1^2 / C_2 \quad \text{mm}$$

$$\text{Effective volume, } V_e = C_1^3 / C_2^2 \quad \text{mm}^3$$

$C_1$  is also used to calculate inductance of a core configuration through

$$L = \frac{4\pi N^2 10^{-9}}{C_1} \quad \text{H}$$

For a toroid,

$$C_1 = (2\pi / h) \log_e (r_2/r_1)$$

Where  $r_1$  = internal radius of toroid

$r_2$  = external radius of toroid

$h$  = height of toroid

### 15. DC bias conditions:

Performance of ferrite as EMI filter under DC bias conditions is considered as one of the significant parameters of ferrite quality. Very large lossy impedance is achieved in ferrite when it is operated under bias condition creating less than the saturating magnetic field. Once saturated, the permeability becomes one (equal to that of vacuum) and this condition is not good for any ferrite applications. The bias field reduces the impedance of ferrite and best impedance is achieved in zero DC bias conditions. Technically the bias conditions are important because there are many EMI suppression applications under DC field. Hence, ferrite with higher saturation magnetization ( $B_s$ ) is required to suit extreme bias conditions. ACME manufactures high  $B_s$  MnZn/NiZn ferrite material for this purpose. Increase in mass of ferrite component can also compensate this requirement.

### 16. Temperature dependence

Permeability increases with temperature to a maximum and drops suddenly after a certain temperature. This temperature is defined as Curie Temperature ( $T_c$ ). Ferrite becomes paramagnetic after this temperature due to the complete disordering of magnetic moments caused by thermal energy.

$T_c$  is normally controlled by the chemistry of ferrite. Thus each grade has its own  $T_c$  value and higher the initial permeability, lower the  $T_c$  value.

Saturation flux density also decreases with temperature. This is again due to the thermal disordering of magnetic moments in ferrite. At  $T_c$ , the flux density reaches zero.

The change in permeability with temperature is quantitatively expressed as Temperature coefficient of permeability (TC). Temperature factor of permeability is given by:

$$\alpha_F = \Delta \mu_i / \mu_i^2 \quad \Delta T$$

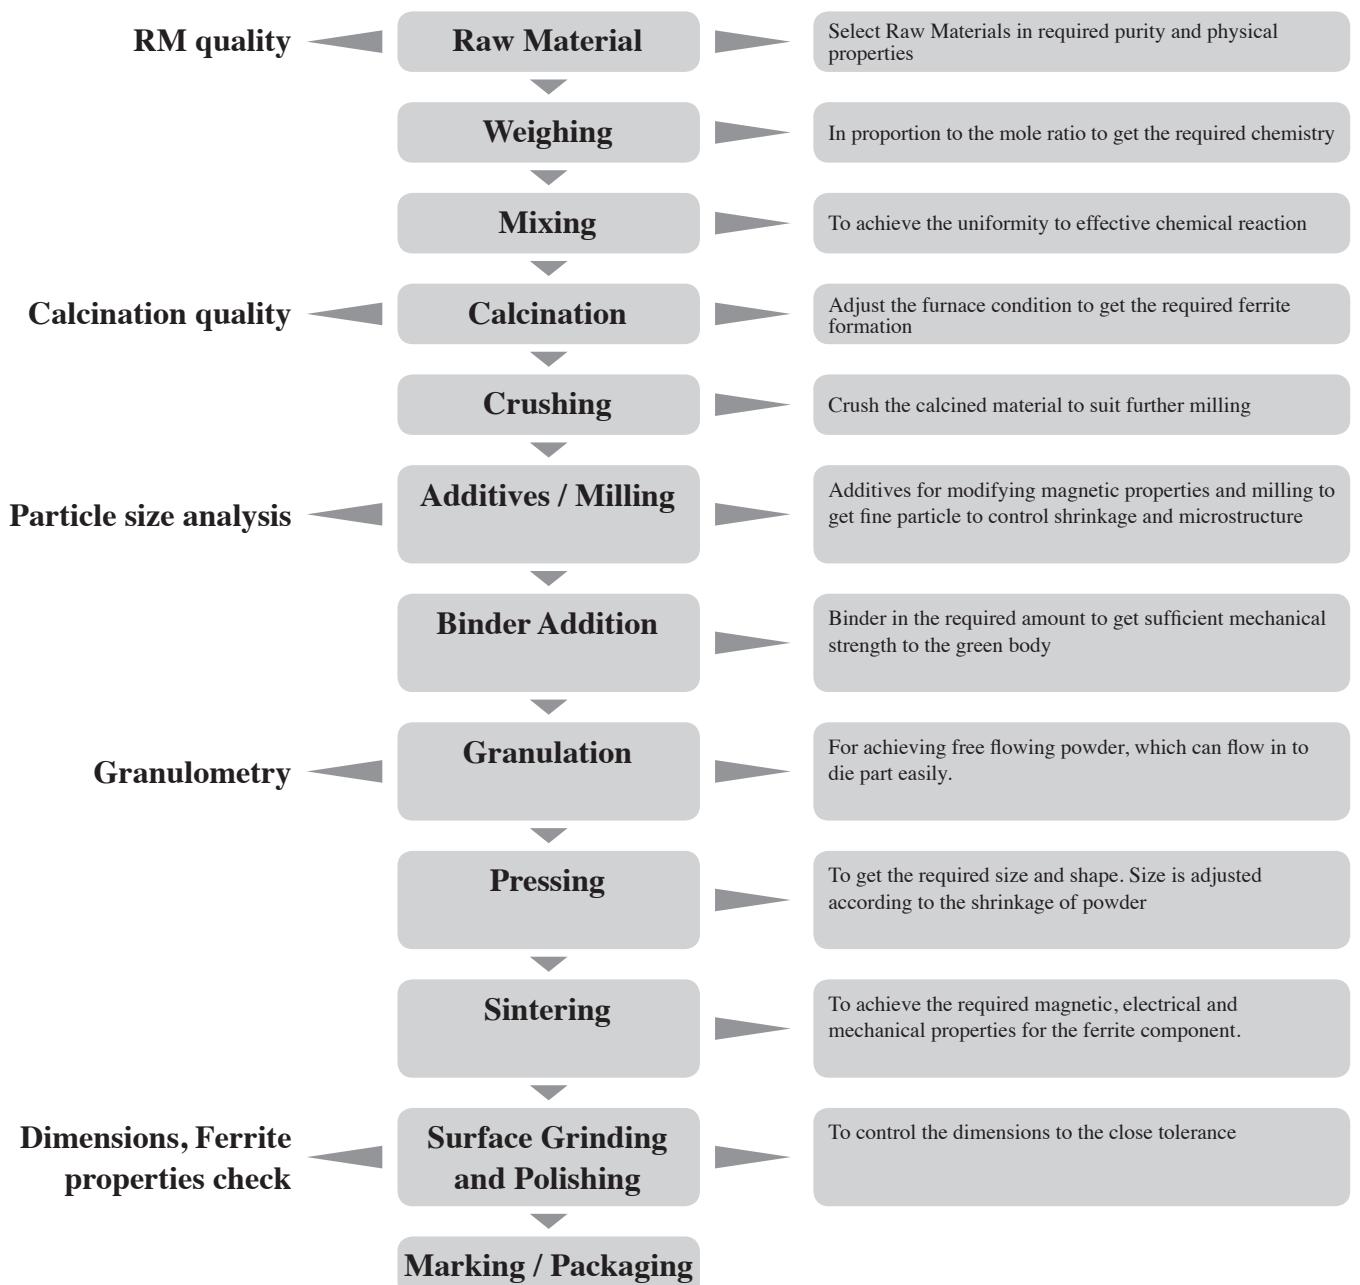

### 17. SELF RESONANT FREQUENCY

It is the frequency at which the distributed capacitance resonates with inductance. The inductor will act purely as a resistor at this condition and provide maximum impedance.

## Ferrite Manufacturing Process:

Ferrite is manufactured by normal ceramic route. This involves Raw material mix in required molar ratios, calcination to get uniform physical properties, milling, compacting to the required shape, sintering and finishing. Most important factors affecting the final properties of ferrite are its chemistry and process conditions and both of these jointly control the microstructure formation, which has a major role on the magnetic and mechanical properties of ferrite.

### Manufacturing flow sheet

## ■ Material Characteristics (1)

	Symbol	Unit	Measuring Conditions			Low Loss Materials

Remark:

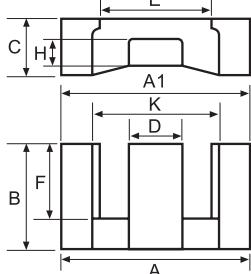

1. AL Value Testing Condition : 10kHz, 50mV, 100Ts. If testing condition is different from ACME's, please specify upon request & ordering.
2. Gapped core is available, please specify upon request & ordering. ACME's standard gapped core set is a combination of one gapped core and one ungapped core. If gapping on both pcs to make a set is needed, please specify upon request & ordering.
3. L : Mirror Finished Lapping. Please specify upon request & ordering by adding "L" at the end of Core Size if you need.

Remark:

1. AL Value Testing Condition : 10kHz, 50mV, 100Ts. If testing condition is different from ACME's, please specify upon request & ordering.
2. Gapped core is available, please specify upon request & ordering. ACME's standard gapped core set is a combination of one gapped core and one ungapped core. If gapping on both pcs to make a set is needed, please specify upon request & ordering.
3. L : Mirror Finished Lapping. Please specify upon request & ordering by adding "L" at the end of Core Size if you need.

Remark:

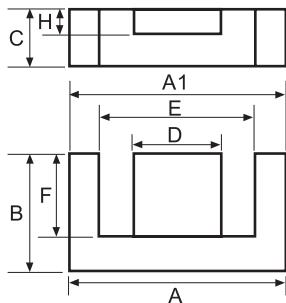

1. AL Value Testing Condition : 10kHz, 50mV, 100Ts. If testing condition is different from ACME's, please specify upon request & ordering.
2. Gapped core is available, please specify upon request & ordering. ACME's standard gapped core set is a combination of one gapped core and one ungapped core. If gapping on both pcs to make a set is needed, please specify upon request & ordering.
3. L : Mirror Finished Lapping. Please specify upon request & ordering by adding "L" at the end of Core Size if you need.

Remark:

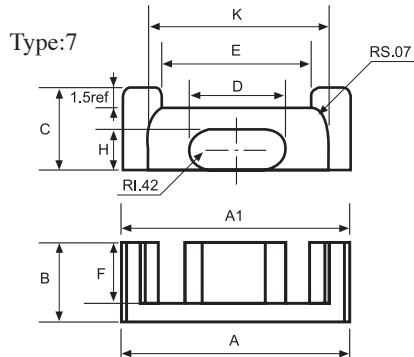

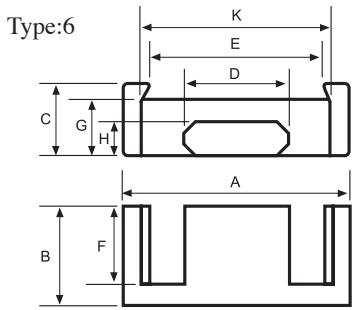

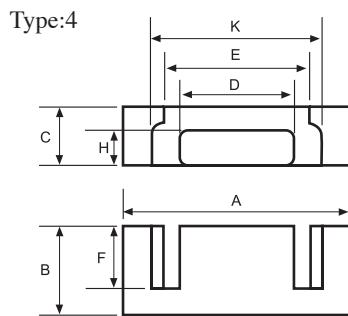

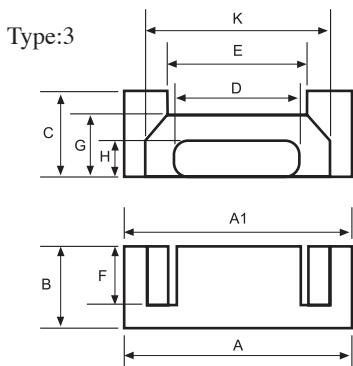

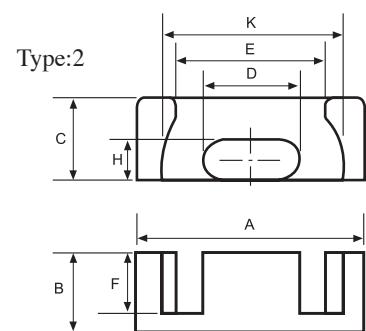

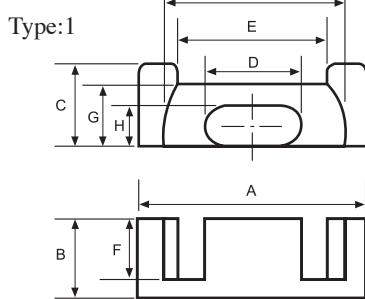

1. AL Value Testing Condition : 10kHz, 50mV, 100Ts. If testing condition is different from ACME's, please specify upon request & ordering.
2. Gapped core is available, please specify upon request & ordering. ACME's standard gapped core set is a combination of one gapped core and one ungapped core. If gapping on both pcs to make a set is needed, please specify upon request & ordering.
3. L : Mirror Finished Lapping. Please specify upon request & ordering by adding "L" at the end of Core Size if you need.

Remark:

1. AL Value Testing Condition : 10kHz, 50mV, 100Ts. If testing condition is different from ACME's, please specify upon request & ordering.
2. Gapped core is available, please specify upon request & ordering. ACME's standard gapped core set is a combination of one gapped core and one ungapped core. If gapping on both pcs to make a set is needed, please specify upon request & ordering.

Remark:

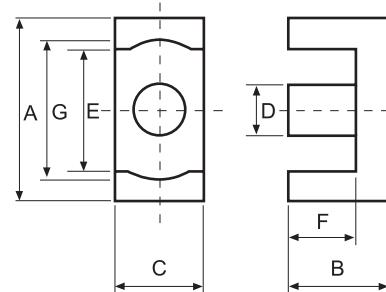

1. AL Value Testing Condition : 10kHz, 50mV, 100Ts. If testing condition is different from ACME's, please specify upon request & ordering.
2. Gapped core is available, please specify upon request & ordering. ACME's standard gapped core set is a combination of one gapped core and one ungapped core. If gapping on both pcs to make a set is needed, please specify upon request & ordering.
3. L : Mirror Finished Lapping. Please specify upon request & ordering by adding "L" at the end of Core Size if you need.

Remark:

1. AL Value Testing Condition : 10kHz, 50mV, 100Ts. If testing condition is different from ACME's, please specify upon request & ordering.
2. Gapped core is available, please specify upon request & ordering. ACME's standard gapped core set is a combination of one gapped core and one ungapped core. If gapping on both pcs to make a set is needed, please specify upon request & ordering.
3. L : Mirror Finished Lapping. Please specify upon request & ordering by adding "L" at the end of Core Size if you need.

Remark:

1. AL Value Testing Condition : 10kHz, 50mV, 100Ts. If testing condition is different from ACME's, please specify upon request & ordering.
2. Gapped core is available, please specify upon request & ordering. ACME's standard gapped core set is a combination of one gapped core and one ungapped core. If gapping on both pcs to make a set is needed, please specify upon request & ordering.
3. L : Mirror Finished Lapping. Please specify upon request & ordering by adding "L" at the end of Core Size if you need.

## Type : EE/EEL Cores

Ordering Code:

P4	EE19	G□
Material 材質	Core Size 品名	Gapped AL Value

Remark:

1. AL Value Testing Condition : 10kHz, 50mV, 1Ts. If testing condition is different from ACME's, please specify upon request & ordering.

2. Coating Material

(1) Toroid Size T8 and Below:clear parylene coating, breakdown voltage:1000Vdc, coating thickness : 0.05mm max.

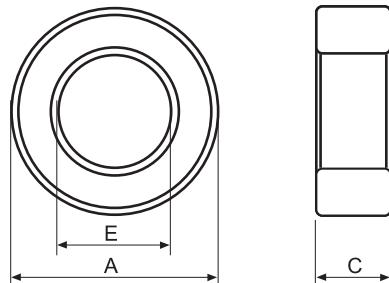

(2) Toroid Size T9 and Above:green epoxy coating, breakdown voltage:1500Vdc, coating thickness : 0.6mm max.
